

UI Screenshots

- The UI design of the Ollama chatbot consists of two main components: model selection and chat interface.

- The model selection dropdown allows users to choose different large language models (LLMs) such as *Llama 3.2 (1B, 7B, 13B)* or *Mistral*. This enables flexibility depending on the required accuracy and computational resources.
- The chat window provides a simple conversational interface where the user's queries are shown in green, while the bot's responses appear in white. The bottom input box allows continuous interaction.

Technically, when a user submits a message, it is sent to the Ollama backend server, processed by the chosen model, and returned as a response in real time.
